

- Quantitative thyroglobulin testing is most commonly used for monitoring patient levels after treatment of thyroid tumors.
- Interpretation of the thyroglobulin testing results requires a concurrent testing for anti-thyroglobulin antibodies.
- Testing for thyroglobulin antibodies is also useful when evaluating for Hashimoto's thyroiditis.
- To avoid incorrect testing and confusion, orders for Thyroglobulin and Anti-Thyroglobulin Antibody testing have been combined into the below ordersets (highlighting added for this document to emphasize guidance statements).

Thyroglobulin Orders

Thyroglobulin Ab

ONCE, First occurrence today at 0910

Tier 1 (all credentialed providers) Order this test when ordering Thyroglobulin Total Quantitative or order this test alone for diagnosis of Hashimoto's thyroiditis

Thyroglobulin Total Quantitative

ONCE, First occurrence today at 0910

Tier 1 (all credentialed providers) Use this lab when concurrent antibody levels are known or ordered separately

Thyroglobulin Orders ✓ Accept

Interpretation of thyroglobulin quantitation requires concurrent testing for thyroglobulin antibodies. This testing selection will order both thyroglobulin quantitation and thyroglobulin antibody. Individual tests are available for selection for evaluation of Hashimoto's thyroiditis or if a concurrent antibody level is already known.

Thyroglobulin Ab - Required when testing for thyroglobulin levels or helpful separately with the diagnosis of Hashimoto's thyroiditis

Thyroglobulin Total Quantitative - When concurrent antibody levels are known or ordered separately
